

Code Fix Solution

1. In the **GetTxtFiles** method, when recursively iterating through subdirectories, the same **directoryPath** is being passed to the recursive call, this results in the method not correctly traversing subdirectories. We can fix this with replacing **GetTxtFiles(directoryPath, txtFiles)** with **GetTxtFiles(subdirectory, txtFiles)** to pass the correct subdirectory path.

```
foreach (string subdirectory in subdirectories)
{
    GetTxtFiles(subdirectory, txtFiles);
}
```

2. In the **AppendTextToFile** method, a **StreamWriter** is being declared and initialized but it is not wrapped in a using statement, so this can lead to resource leaks if the writer is not disposed of. We can fix this if we use a **using** statement to ensure that the StreamWriter is properly disposed of after use.

```
static void AppendTextToFile(string filePath, string textToAppend)
{
    using (StreamWriter writer = File.AppendText(filePath))
    {
        writer.WriteLine(textToAppend);
    }
}
```
